Liquid Crystals Beyond Displays - Advanced Science News

LCLCs represent a broad but not well-understood class of soft matter in which the reversible self-assembled aggregates formed by non-amphiphilic molecules show liquid crystalline phases [4–7]. The range of materials which forms chromonic LC phases includes drugs [2, 3, 8–10], dyes [11–14], and DNA nucleotides, such as guanosine derivatives [15, 16].
