The graphical representation of the problem is given below and from that we have that the solution lies at the intersection of $(x_C / 4) + x_T = 4$ and $6x_T + 3x_C = 40$. Solving these two equations simultaneously we get $x_C = 10.667$, $x_T = 1.333$ and the corresponding profit = £146.667

Sensitivity Analysis: An Example

INTRODUCTION. Operational Research is the scientific study of operations for the purpose of making better decisions. Operations Research is an Art and Science. It is a science which deals with problem, formulation, solutions and finally appropriate decision making. It is most often used to analyze complex real life problems typically with the goal of improving or optimizing performance.

Graphical Method To Solve
This method is used to solve a two-variable linear program. If you have only two decision variables, you should use the graphical method to find the optimal solution. A graphical method involves formulating a set of linear inequalities subject to the constraints. Then the inequalities are plotted on an X-Y plane.
